

Eric White

The purpose of my final was to create a music box with two different songs the leds would form a pattern based on the music that would be playing there would be a button that controls the sketch when you press it the mouth would open and the music would play and send data to the leds to work based on the music frequencies. At first when i was making the coding just for the leds to work everything was going fine the patterns were accurate and there was no delay i have a video of it working but once i involved a button everything started to break the handshaking was not working right so i spent 3-4 days trying to figure out how to make it work right eventually i did get it to work with the button but there was still a big delay button the button and sketch and leds.
